Package 'iotables'

January 8, 2024

Type Package

Title Reproducible Input-Output Economics Analysis, Economic and
Environmental Impact Assessment with Empirical Data

Date 2024-01-08

Version 0.9.3

Maintainer Daniel Antal <daniel.antal@dataobservatory.eu>

Description Pre-processing and basic analytical tasks related to working
with Eurostat's symmetric input-output tables and provide basic
input-output economics calculations. The package is part of rOpenGov
<http://ropengov.github.io/> to open source open government initiatives.

---

airpol_get *Get air pollutant data*

Description

Get air emissions accounts by NACE Rev. 2 activity for environmental impact assessments.

Usage

```
airpol_get(
  airpol = "GHG",
  geo = "BE",
  year = 2020,
  unit = "THS_T",
  data_directory = NULL,
  force_download = TRUE
)
```

Arguments

airpol	The code of the air pollutant. Defaults GHG. ACG, CH4, CH4_CO2E, CH4_NMVOCE, CO, CO2, CO2_BIO, CO_NMVOCE, GHG, HFC_CO2E, N2O, N2O_CO2E, NF3_SF6_CO2E, NH3, NH3_SO2E, NMVOC, NOX, NOX_NMVOCE, NOX_SO2E, O3PR, PFC_CO2E, PM10, PM2_5, SOX_SO2E.
geo	The country code. The special value 'germany_1995' will return the replication dataset [germany_airpol]().
year	The year. The average employment will be created for the given year, starting with 2008, when the NACE Rev 2 was introduced in employment statistics.
unit	Defaults to "THS_T" (thousand tons.)
data_directory	Defaults to NULL, if a valid directory, it will try to save the pre-processed data file here with labelling.
force_download	Defaults to TRUE. If FALSE it will use the existing downloaded file in the data_directory or the temporary directory, if it exists.

Details

Currently tested only with product x product tables. The dataset air emissions accounts by NACE Rev. 2 activity [env_ac_ainah_r2] has five dimensions: The Air pollutant `airpol` variables are collected on the emissions of the following pollutants: carbon dioxide without emissions from biomass (CO2), carbon dioxide from biomass (Biomass CO2), nitroux oxide (N2O), methane (CH4), perfluorocarbons (PFCs), Hydrofluorocarbons (HFCs), sulphur hexafluoride (SF6) including nitrogen trifluoride (NF3), nitrogen oxides (NOx), Non-methane volatile organic compounds, (NMVOC), carbon monoxide (CO), Particulate matter smaller than 10 micrometre (PM10), Particulate matter smaller than 2,5 micrometre (PM2,5), Sulphur dioxide (SO2), Ammonia (NH3).

See Reference Metadata in Single Integrated Metadata Structure (SIMS) for further details, particularly on the calculation of Global warming potential `GHG`, Acidifying gases `ACG` and Tropospheric ozone precursors `O3PR`.

Value

A data.frame with auxiliary metadata to conform the symmetric input-output tables.

Source

Eurostat folder Air emissions accounts by NACE Rev. 2 activity

See Also

Other import functions: `employment_get()`, `iotables_download()`, `iotables_metadata_get()`, `iotables_read_tempdir()`

Examples

```
airpol_get(airpol = "CO2", geo="germany_1995", year = 1995, unit = "THS_T")
```

---

backward_linkages   *Backward linkages*

Description

Indicate the interconnection of a particular sector to other sectors from which it purchases inputs (demand side). When a sector increases its output, it will increase the total (intermediate) demand on all other sectors, which is measured by backward linkages.

Usage

```
backward_linkages(Im)
```

Arguments

Im   A Leontief inverse matrix created by the `leontief_inverse_create` function.

Details

Backward linkages are defined as the column sum of the Leontief inverse, in line with the Eurostat Manual of Supply, Use and Input-Output Tables (see p506-507.) and the Handbook on Supply and Use Tables and Input-Output Tables with Extensions and Applications of the United Nations (see p636,)

Value

The vector of industry (product) backward linkages in a wide data.frame class, following the column names of the Leontief inverse matrix.

See Also

Other linkage functions: [forward_linkages](https://)()

Examples

```
de_coeff <- input_coefficient_matrix_create( iotable_get(),
                                             digits = 4 )
I <- leontief_inverse_create (de_coeff)
backward_linkages (I)
```

---

coefficient_matrix_create

Create a coefficient matrix

Description

Create a coefficient matrix from a Symmetric Input-Output Table.

Usage

```
coefficient_matrix_create(
  data_table,
  total = "output",
  digits = NULL,
  remove_empty = TRUE,
  households = FALSE,
  return_part = NULL
)
```

Arguments

data_table	A symmetric input-output table, a use table, a margins or tax table retrieved by the [iotable_get](https://) function.
total	Usually an output vector with a key column, defaults to "output" which equals "P1" or "output_bp". You can use other rows for comparison, for example "TS_BP" if it exists in the matrix.

digits   An integer showing the precision of the technology matrix in digits. Default is
                      `NULL` when no rounding is applied.

remove_empty   Defaults to `TRUE`. If you want to keep empty primary input rows, choose `FALSE`.
                      Empty product/industry rows are always removed to avoid division by zero error
                      in the analytic functions.

households   Defaults to `NULL`. Household column can be added with `TRUE`.

return_part   Defaults to `NULL`. You can choose `"product"` or `"industry"` to return an input
                      coefficient matrix or `"primary_inputs"` to get only the total intermediate use
                      and proportional primary inputs.

Details

The coefficient matrix is related by default to output, but you can change this to total supply or other
total aggregate if it exists in your table.

Value

A data.frame that contains the matrix of `data_table` divided by `total` with a key column. Option-
ally the results are rounded to given `digits`.

References

See United Kingdom Input-Output Analytical Tables 2010 for explanation on the use of the Coeffi-
cient matrix.

See Also

Other indicator functions: `direct_effects_create()`, `input_indicator_create()`

Examples

```
coefficient_matrix_create(data_table = iotable_get(source = "germany_1995"),
                          total = "output",
                          digits = 4 )
```

---

  conforming_vector_create
                               Create an empty conforming vector

---

Description

This helper function creates you a named vector that conforms your analytical objects, such as the
use table, the Leontief-matrix, etc. With 60x60 matrixes it is easy to make mistakes with manual
definition. The empty effects vector can be used in `.csv` format as a sample to import scenarios
from a spreadsheet application.

Usage

```
conforming_vector_create(data_table)
```

Arguments

data_table   A use table, Leontief-matrix, Leontief-inverse, a coefficient matrix or other named matrix / vector.

Value

A wide-format conforming vector of data frame class, with column names matching the metadata of the data_table.

See Also

Other iotables processing functions: household_column_get(), iotable_year_get(), key_column_create(), matrix_round(), output_get(), primary_input_get(), rows_add(), supplementary_add(), total_tax_add(), vector_transpose_longer(), vector_transpose_wider()

Examples

```
de_input_flow <- input_flow_get(data_table = iotable_get())

conforming_vector_create (data_table = de_input_flow)
```

---

croatia_2010_1700   *Input-output table for Croatia, 2010.*

Description

1700 - Symmetric input-output table at basic prices (product x product) In thousand kunas (T_NAC)

Usage

```
data(croatia_2010_1700)
```

Format

A data frame with 13 variables.

t_rows2 Technology codes in row names, following the Eurostat convention.

t_rows2_lab Longer labels for t_rows2

t_cols2 Technology codes in column names, following the Eurostat convention.

t_cols2_lab Longer labels for t_cols2

iotables_col The standardized iotables column labelling for easier reading.

col_order The column ordering to keep the matrix legible.

row_order The row ordering to keep the matrix legible.

iotables_row The standardized iotables row labelling for easier reading.

unit Different from Eurostat tables, in thousand national currency units.

geo ISO / Eurostat country code for Croatia

geo_lab ISO / Eurostat country name, Croatia.

time Date of the SIOT

values The actual values of the table in thousand kunas

Source

[Državni zavod za statistiku](.).

See Also

Other Croatia 2010 datasets: `croatia_2010_1800`, `croatia_2010_1900`, `croatia_employment_2013`, `croatia_employment_aggregation`, `primary_inputs`

---

croatia_2010_1800 *Input-output table for Croatia, 2010.*

Description

1800 - Symmetric input-output table for domestic production (product x product) In thousand kunas (T_NAC)

Usage

```
data(croatia_2010_1800)
```

Format

A data frame with 13 variables.

t_rows2 Technology codes in row names, following the Eurostat convention.

t_rows2_lab Longer labels for t_rows2

values The actual values of the table in thousand kunas

t_cols2 Column labels, following the Eurostat convention with differences. CPA_ suffix added to original DZS column names.

t_cols2_lab Longer labels for t_cols2

iotables_col The standardized iotables column labelling for easier reading.

col_order The column ordering to keep the matrix legible.

iotables_row The standardized iotables row labelling for easier reading.

row_order The row ordering to keep the matrix legible.

unit Different from Eurostat tables, in thousand national currency units.

geo ISO / Eurostat country code for Croatia

geo_lab ISO / Eurostat country name, Croatia.

time Date of the SIOT

Source

Državni zavod za statistiku.

See Also

Other Croatia 2010 datasets: croatia_2010_1700, croatia_2010_1900, croatia_employment_2013, croatia_employment_aggregation, primary_inputs

---

croatia_2010_1900   *Input-output table for Croatia, 2010.*

Description

1900 - Symmetric input-output table for imports (product x product) In thousand kunas (T_NAC)

Usage

```
data(croatia_2010_1900)
```

Format

A data frame with 13 variables.

t_rows2 Technology codes in row names, following the Eurostat convention.

t_rows2_lab Longer labels for t_rows2

values The actual values of the table in thousand kunas

t_cols2 Column labels, following the Eurostat convention with differences. CPA_ suffix added to original DZS column names.

t_cols2_lab Longer labels for t_cols2

iotables_col The standardized iotables column labelling for easier reading.

col_order The column ordering to keep the matrix legible.

iotables_row The standardized iotables row labelling for easier reading.

row_order The row ordering to keep the matrix legible.

unit Different from Eurostat tables, in thousand national currency units.

geo ISO / Eurostat country code for Croatia

geo_lab ISO / Eurostat country name, Croatia.

time Date of the SIOT

Source

Državni zavod za statistiku.

See Also

---

`croatia_employment_2013`

Croatian employment data for the year 2013

Description

Aggregate Croatian detailed employment statistics into the Croatian (EU standard) Symmetric input-output table format.

Usage

```
data(croatia_employment_2013)
```

Format

A data frame with 107 observations in 2 variables:

code Short labels

iotables_row iotables style labels

employment Employment in the sector in Croatia, not in thousands!

See Also

Other Croatia 2010 datasets: `croatia_2010_1700`, `croatia_2010_1800`, `croatia_2010_1900`, `croatia_employment_aggregation`, `primary_inputs`

`croatia_employment_aggregation`

Aggregation table for Croatian employment statistics

Description

Aggregate Croatian detailed employment statistics into the Croatian (EU standard) Symmetric input-output table format.

Usage

```
data(croatia_employment_aggregation)
```

Format

A data frame with 105 rows (including empty ones) and 2 variables.

employment_label Labelling in DZS English language export

t_cols2 Labelling of EU/DZS SIOTs.

See Also

Other Croatia 2010 datasets: croatia_2010_1700, croatia_2010_1800, croatia_2010_1900, croatia_employment_2013, primary_inputs

---

direct_effects_create   *Create direct effects*

Description

The function creates the effects.

Usage

```
direct_effects_create(input_requirements, inverse, digits = NULL)
```

Arguments

input_requirements

A matrix or vector created by input_indicator_create

inverse   A Leontief-inverse created by leontief_inverse_create.

digits   Rounding digits, defaults to NULL, in which case no rounding takes place.

Value

A data.frame containing the direct effects and the necessary metadata to sort them or join them with other matrixes.

See Also

Other indicator functions: coefficient_matrix_create(), input_indicator_create()

Examples

```
nl <- netherlands_2006

input_coeff_nl <- input_coefficient_matrix_create(
 data_table  = netherlands_2006,
 households = FALSE)

compensation_indicator <- input_indicator_create(netherlands_2006, 'compensation_employees')

I_nl <- leontief_inverse_create( input_coeff_nl )

direct_effects_create(input_requirements = compensation_indicator,
                       inverse = I_nl)
```

---

employment_get   *Get employment data*

Description

Download the employment data for a country and arrange it to the 64x64 SIOTs.

Usage

```
employment_get(
  geo,
  year = "2010",
  sex = "Total",
  age = "Y_GE15",
  labelling = "iotables",
  data_directory = NULL,
  force_download = FALSE
)
```

Arguments

geo	The country code.
year	The year. The average employment will be created for the given year, starting with 2008, when the NACE Rev 2 was introduced in employment statistics.
sex	Defaults to "Total". Enter "Females" or "F" for female employment, "Males" or "M" for male employment.
age	Defaults to "Y_GE15", which is the Eurostat code for employment in all age groups starting from 15-years-old. Any Eurostat code can be used as a parameter.
labelling	Either "iotables" or the applicable short code, for product x product SIOTs "prod_na" and in the case of industry x industry SIOTs "induse".
data_directory	Defaults to NULL, if a valid directory, it will try to save the pre-processed data file here with labelling.
force_download	Defaults to FALSE. It will use the existing downloaded file in the data_directory or the temporary directory, if it exists.

Details

Currently works only with product x product tables.

Value

A data.frame with auxiliary metadata to conform the symmetric input-output tables.

Source

Eurostat statistic [Employment by sex, age and detailed economic activity (from 2008 onwards, NACE Rev. 2 two digit level) - 1 000](#)

See Also

Other import functions: [airpol_get](#)(), [iotables_download](#)(), [iotables_metadata_get](#)(), [iotables_read_tempdir](#)()

Examples

```
## Not run:
 io_tables <- get_employment (
               geo = "CZ",
               year = "2010",
               sex = "Total",
               age = "Y_GE15",
               data_directory = NULL,
               force_download = TRUE
               )

## End(Not run)
```

---

employment_metadata   *Employment metadata*

Description

An arrangement of the Eurostat national accounts vocabulary to match with employment statistics data.

Usage

```
data(employment_metadata)
```

Format

A data frame with 6 variables.

emp_code code used in the employment statistics

code Eurostat labels for SIOTs corresponding to emp_code

label Eurostat label descriptions for SIOTs corresponding to emp_code

variable Eurostat vocabulary source, i.e. t_rows, t_cols, prod_na, induse

group Different from Eurostat tables, in thousand national currency units.

iotables_label Custom, machine_readable snake format variable names

See Also

Other Metadata datasets: [metadata_uk_2010](#), [metadata](#)

---

empty_remove   *Symmetrically remove empty rows and columns*

Description

Symmetrically remove columns with only zero values or with missing values.

Usage

```
empty_remove(data_table)
```

Arguments

data_table   A symmetric input-output table, or a symmetric part of a use table or a supply table.

Value

A tibble/data.frame with a key row and a symmetric matrix, after removing all empty columns and rows at the same time.

Examples

```
test_table <- input_coefficient_matrix_create(iotable_get(source = "germany_1995"))
test_table[, 2] <- 0
empty_remove (test_table)
```

---

equation_solve   *Solve a basic (matrix) equation*

Description

The function matches to parts of the matrix equation, using the named formats with row names and solves the matrix equation.

Usage

```
equation_solve(LHS = NULL, Im = NULL)
```

Arguments

LHS   A left-hand side vector with a key column containing the industry or product names for matching, for example the employment coefficients.

Im   A Leontief-inverse with a key column containing the industry or product names for matching.

Details

This function is used in wrapper functions, such as [multiplier_create](). to solve particular problems, but it can be used directly, too. The function only performs the lhs pairing industries and checking for exceptions.

Value

A data.frame with auxiliary metadata to conform the symmetric input-output tables.

Examples

```
Im = data.frame (
a = c("row1", "row2"),
b = c(1,1),
c = c(2,0))
LHS = data.frame (
a = "lhs",
b = 1,
c = 0.5)
equation_solve (Im = Im, LHS = LHS)
```

---

forward_linkages   *Forward linkages*

Description

The increased output of a sector indicates that additional amounts of products are available to be used as inputs by other sectors which can increase their production, which is captured in this indicator vector.

Usage

```
forward_linkages(output_coefficient_matrix, digits = NULL)
```

Arguments

output_coefficient_matrix

> An output coefficient matrix created with the [output_coefficient_matrix_create]() function.

digits   Number of decimals for rounding, defaults to `NULL`.

Details

Forward linkages as defined by the Eurostat Manual of Supply, Use and Input-Output Tables (pp. 506–507) and the United Nations Handbook on Supply and Use Tables and Input-Output Tables with Extensions and Applications p637.

Value

The vector of industry (product) forward linkages in a long-form data.frame, containing the meta-data column of the the row names from the `output_coefficient_matrix`.

See Also

Other linkage functions: `backward_linkages()`

Examples

```
data_table = iotable_get()

de_out <- output_coefficient_matrix_create (
 data_table, "tfu", digits = 4
 )

forward_linkages(output_coefficient_matrix = de_out,
                 digits = 4 )
```

---

germany_1995   *Simple input-output table for Germany, 1995.*

Description

Replication data taken from the Eurostat Manual, Table 15.4: Input-output table of domestic output at basic prices (Version A)

Usage

```
data(germany_1995)
```

Format

A data frame with 228 observations and 10 variables.

prod_na Technology codes in row names, following the Eurostat convention.

prod_na_lab Longer labels for t_rows2.

induse Column labels, following the Eurostat convention with differences.

iotables_row Row labels, i.e. to be used in key column, for iotables package abbreviations.

iotables_col Column labels for iotables package abbreviations.

values The actual values of the table in million euros.

unit MIO_EUR, the same as Eurostat.

unit_lab Million euros. Eurostat usually has euro and national currency unit values, too.

geo ISO/Eurostat country code for Germany, i.e. DE.

geo_lab ISO/Eurostat country name, Germany.

time Date of the SIOT.

Details

For testing and documentation purposes a well documented example is taken the Eurostat Manual. The table in the Eurostat manual is brought to the format used by the Eurostat database. It is a small dataset for examples, but it is also instructive to understand how Eurostat stores the highly structured SIOTs in long-form tidy datasets. The labels were slightly alterred to reflect the transition from the vocabulary of ESA95 to ESA2010 since the publication of the Manual.

Source

[Eurostat Manual of Supply, Use and Input-Output Tables](#) p 482

See Also

Other Validation datasets: `germany_airpol`, `netherlands_2006`, `uk_2010_data`, `uk_test_results`

---

germany_airpol   *Air Pollution Table for Germany, 1995.*

Description

Air pollution values for validation.

Usage

```
data(germany_airpol)
```

Format

A data frame with 72 observations and 4 variables.

airpol The abbreviation of the air pollutant.

induse Column labels, following the Eurostat convention with differences.

iotables_col Column labels for iotables package abbreviations.

value The actual values of the table in thousand tons.

Details

For testing purposes and cross-checking with the Eurostat manual. The labels were slightly alterred to reflect the transition from the vocabulary of ESA95 to ESA2010 since the publication of the Manual.

Source

[Eurostat Manual of Supply, Use and Input-Output Tables](#) p 482.

Other Validation datasets: `germany_1995`, `netherlands_2006`, `uk_2010_data`, `uk_test_results`

---

ghosh_inverse_create   *Create the inverse of a Ghosh-matrix*

Description

Create the Ghosh-inverse from the output coefficients.

Usage

```
ghosh_inverse_create(output_coefficients_matrix, digits = NULL)
```

Arguments

output_coefficients_matrix

A technology coefficient matrix created by the output_coefficient_matrix_create.

digits   An integer showing the precision of the technology matrix in digits. Default is
                NULL when no rounding is applied.

Details

The Ghosh-inverse is

$$G = (I - B)^-1$$

where B is the output coefficient matrix created by output_coefficient_matrix_create. See
the United Nations Handbook on Supply and Use Tables and Input-Output Tables with Extensions
and Applications pp 622–639.

For the similar inverse created from input coefficients, see the leontief_inverse_create func-
tion.

See Also

Other analytic object functions: input_flow_get(), leontief_inverse_create(), leontief_matrix_create()

Examples

```
om <- output_coefficient_matrix_create(
  data_table = iotable_get()
  )

ghosh_inverse_create( output_coefficients_matrix = om )
```

household_column_find *Return the position of final household expenditure*

Description

Return the position of final household expenditure

Usage

```
household_column_find(data_table)
```

Arguments

data_table   A symmetric input output table, a use table or a supply table.

Value

An integer value with the final household expenditure. Returns NULL if not found.

Examples

```
household_column_find( iotable_get ( source = 'germany_1995') )
```

household_column_get *Return Final Household Expenditure*

Description

Return Final Household Expenditure

Usage

```
household_column_get(data_table)
```

Arguments

data_table   A symmetric input output table, a use table or a supply table.

Value

The column containing final household expenditure. If not found NULL is returned.

See Also

Other iotables processing functions: conforming_vector_create(), iotable_year_get(), key_column_create(), matrix_round(), output_get(), primary_input_get(), rows_add(), supplementary_add(), total_tax_add(), vector_transpose_longer(), vector_transpose_wider()

Examples

```
household_column_get(iotable_get (source = 'germany_1995'))
```

---

indirect_effects_create
                                        Create indirect effects

---

Description

The function creates the indirect effects vector.

Usage

```
indirect_effects_create(input_requirements, inverse, digits = NULL)
```

Arguments

input_requirements

        A matrix or vector created by `input_indicator_create`

inverse   A Leontief-inverse created by `leontief_inverse_create`.

digits   Rounding digits, defaults to NULL, in which case no rounding takes place.

Value

A data.frame containing the indirect effects and the necessary metadata to sort them or join them with other matrixes.

Examples

```
nl <- netherlands_2006

input_coeff_nl <- input_coefficient_matrix_create(
 data_table  = netherlands_2006,
 households = FALSE)

compensation_indicator <- input_indicator_create(netherlands_2006, 'compensation_employees')

I_nl <- leontief_inverse_create(input_coeff_nl)

indirect_effects_create(input_requirements = compensation_indicator,
                        inverse = I_nl)
```

---

input_coefficient_matrix_create

Create an input coefficient matrix

Description

Create an input coefficient matrix from the input flow matrix and the output vector. The two input vectors must have consistent labelling, i.e the same column names must be found in the use table (input flow) and the output vector.

Usage

```
input_coefficient_matrix_create(data_table, households = FALSE, digits = NULL)
```

Arguments

data_table   A symmetric input-output table, a use table, a margins or tax table retrieved by the [iotable_get](#) function.

households   Defaults to NULL. Household column can be added with TRUE.

digits   An integer showing the precision of the technology matrix in digits. Default is NULL when no rounding is applied.

Details

The input coefficients of production activities may be interpreted as the corresponding cost shares for products and primary inputs in total output. Our terminology follows the [Eurostat Manual of Supply, Use and Input-Output Tables](#). Input-Output Multipliers Specification Sheet and Supporting Material, Spicosa Project Report, which cannot be linked due to a malformatted url, but can be found with a search engine. this matrix is called 'technological coefficients'. The results of the function are tested on both sources. This is a wrapper function around [coefficient_matrix_create](#).

Value

A data frame that contains the matrix of first quadrant of the use table as input_flow divided by output supported by a key column of product or industries, with a key column. Optionally the results are rounded to given digits.

An input coefficient matrix of data.frame class. The column names are ordered, and the row names are in the first, auxiliary metadata column.

Examples

```
input_coefficient_matrix_create (
                        iotable_get(),
                        digits = 4 )

#This is a wrapper function and equivalent to
```

```
coefficient_matrix_create( iotable_get(),
                           total = "total",
                           return = "products")
```

---

input_flow_get   *Create an inter-industry or input flow matrix*

Description

Select the first quadrant of the symmetric input-output table.

Usage

```
input_flow_get(data_table, empty_remove = FALSE, households = TRUE)
```

Arguments

data_table	A symmetric input-output table or use table retrieved by the iotable_get function.
empty_remove	Defaults to TRUE. If you want to keep empty primary input rows, choose FALSE. Empty product/industry rows are always removed to avoid division by zero error in the analytic functions.
households	Defaults to FALSE. If TRUE, the final household expenditure is added to the input flow table.

Details

The first quadrant is called the input flow matrix, or the input requirements matrix, or the inter-industry matrix in different contexts.

Value

A data flow matrix (a symmetric use table) with a key column.

See Also

Other analytic object functions: ghosh_inverse_create(), leontief_inverse_create(), leontief_matrix_create()

Examples

```
input_flow <- input_flow_get(data_table = iotable_get(),
                             empty_remove = FALSE,
                             households = TRUE)
```

input_indicator_create

Create input indicator(s)

Description

The function creates the input indicators from the inputs and the outputs.

Usage

```
input_indicator_create(
  data_table,
  input_row = c("gva_bp", "net_tax_production"),
  digits = NULL,
  households = FALSE,
  indicator_names = NULL
)
```

Arguments

data_table	A symmetric input-output table, a use table, a margins or tax table retrieved by the [iotable_get](#) function.
input_row	The name of input(s) for which you want to create the indicator(s). Must be present in the data_table.
digits	Rounding digits, if omitted, no rounding takes place.
households	If the households column should be added, defaults to FALSE.
indicator_names	
	The names of new indicators. Defaults to NULL when the names in the key column of input_matrix will be used to create the indicator names.

Value

A tibble (data frame) containing the input_matrix divided by the output_vector with a key column for products or industries.

See Also

Other indicator functions: [coefficient_matrix_create](#)(), [direct_effects_create](#)()

Examples

```
input_indicator_create( data_table = iotable_get(),
                        input_row = c("gva", "compensation_employees"),
                        digits = 4,
                        indicator_names = c("GVA indicator", "Income indicator"))
```

---

input_multipliers_create

Create input multipliers

Description

The function creates the multipliers (direct + indirect effects).

Usage

```
input_multipliers_create(
  input_requirements,
  Im,
  multiplier_name = NULL,
  digits = NULL
)
```

Arguments

input_requirements

A matrix or vector created by [input_indicator_create](#)

Im   A Leontief-inverse created by [leontief_inverse_create](#).

multiplier_name

An optional name to be placed in the key column of the multiplier. Defaults to
NULL.

digits   Rounding digits, defaults to NULL, in which case no rounding takes place. Round-
ing is important if you replicate examples from the literature, rounding differ-
ences can add up to visible differences in matrix equations.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column, containing an
automatically given row identifier (for joining with other matrixes) which can be overruled with
setting multiplier_name.

See Also

Other multiplier functions: [multiplier_create](#)()

Examples

```
nl <- netherlands_2006

input_coeff_nl <- input_coefficient_matrix_create(
 data_table  = netherlands_2006,
 households = FALSE)
```

```
compensation_indicator <- input_indicator_create(netherlands_2006, 'compensation_employees')

I_nl <- leontief_inverse_create(input_coeff_nl)

input_multipliers_create(input_requirements = compensation_indicator,
                         Im = I_nl)
```

---

iotables_download   *Download input-output tables*

Description

This function downloads standard input-output table files. Currently only Eurostat files are supported. You are not likely to use this function, because [iotable_get](#) will call this function if necessary and properly filter out an input-output table.

Usage

```
iotables_download(
  source = "naio_10_cp1700",
  data_directory = NULL,
  force_download = FALSE
)
```

Arguments

source	See the available list of sources above in the Description.
data_directory	Defaults to NULL when the files will be temporarily stored in the path retrieved by [tempdir](#). If it is a different valid directory, it will try to save the pre-processed data file here with labelling.
force_download	Defaults to FALSE which will use the existing downloaded file in the data_directory or the temporary directory, if it exists. TRUE will try to download the file from the Eurostat warehouse.

Details

The data is downloaded in the tempdir()under the name the statistical product as an rds file. (For example: naio_10_cp1750.rds) The temporary directory is emptied at every normal R session exit.

To save the file for further use (which is necessary in analytical work because download times are long) set the download_directory [see parameters]. The function will make a copy of the rds file in this directory.

naio_10_cp1700 Symmetric input-output table at basic prices (product by product)

naio_10_pyp1700 Symmetric input-output table at basic prices (product by product) (previous years prices)

naio_10_cp1750 Symmetric input-output table at basic prices (industry by industry)

naio_10_pyp1750 Symmetric input-output table at basic prices (industry by industry) (previous years prices)

naio_10_cp15 Supply table at basic prices incl. transformation into purchasers' prices

naio_10_cp16 Use table at purchasers' prices

naio_10_cp1610 Use table at basic prices

naio_10_pyp1610 Use table at basic prices (previous years prices) (naio_10_pyp1610)

naio_10_cp1620 Table of trade and transport margins at basic prices

naio_10_pyp1620 Table of trade and transport margins at previous years' prices

naio_10_cp1630 Table of taxes less subsidies on products at basic prices

naio_10_pyp1630 Table of taxes less subsidies on products at previous years' prices

uk_2010_siot United Kingdom Input-Output Analytical Tables data

Value

A nested data frame. Each input-output table is in a separate row of the nested output, where all the metadata are in columns, and the actual, tidy, ordered input-output table is in the data data column. The data is saved into the actual tempdir(), too.

See Also

Other import functions: `airpol_get()`, `employment_get()`, `iotables_metadata_get()`, `iotables_read_tempdir()`

Examples

```
io_tables <- iotables_download(source = "naio_10_pyp1750")
```

---

iotables_metadata_get   *Get Metadata from Nested iotables File*

Description

Remove the data column and return only the metadata information of input-output (or related tables) from a source. If dat is not inputed as a nested data frame created by `iotables_download`, validate the source input parameter and try to load the table from the current sessions' temporary directory.

naio_10_cp1700 Symmetric input-output table at basic prices (product by product)

naio_10_pyp1700 Symmetric input-output table at basic prices (product by product) (previous years prices)

naio_10_cp1750 Symmetric input-output table at basic prices (industry by industry)

naio_10_pyp1750 Symmetric input-output table at basic prices (industry by industry) (previous years prices)

naio_10_cp15 Supply table at basic prices incl. transformation into purchasers' prices

naio_10_cp16 Use table at purchasers' prices

naio_10_cp1610 Use table at basic prices

naio_10_pyp1610 Use table at basic prices (previous years prices) (naio_10_pyp1610)

naio_10_cp1620 Table of trade and transport margins at basic prices

naio_10_pyp1620 Table of trade and transport margins at previous years' prices

naio_10_cp1630 Table of taxes less subsidies on products at basic prices

naio_10_pyp1630 Table of taxes less subsidies on products at previous years' prices

uk_2010_siot United Kingdom Input-Output Analytical Tables data

Usage

```
iotables_metadata_get(dat = NULL, source = "naio_10_cp1700")
```

Arguments

dat A nested data file created by [iotables_download](). Defaults to NULL in which case an attempt is made to find and read in the nested data from the current R sessions' temporary directory.

source See the available list of sources above in the Description.

Value

A data frame, which contains the metadata of all available input-output tables from a specific source.

See Also

Other import functions: [airpol_get](), [employment_get](), [iotables_download](), [iotables_read_tempdir]()

Examples

```
# The table must be present in the sessions' temporary directory:
iotables_download(source = "naio_10_pyp1750")

# Now you can get the metadata:
iotables_metadata_get(source = "naio_10_pyp1750")
```

iotables_read_tempdir   *Read input-output tables from temporary directory*

Description

Validate the `source` input parameter and try to load the table from the current sessions' temporary directory.

Usage

```
iotables_read_tempdir(source = "naio_10_cp1700")
```

Arguments

source   See the available list of sources above in the Description. Defaults to `source = "naio_10_cp1700"`.

Details

Possible `source` parameters:

`naio_10_cp1700` Symmetric input-output table at basic prices (product by product)

`naio_10_pyp1700` Symmetric input-output table at basic prices (product by product) (previous years prices)

`naio_10_cp1750` Symmetric input-output table at basic prices (industry by industry)

`naio_10_pyp1750` Symmetric input-output table at basic prices (industry by industry) (previous years prices)

`naio_10_cp15` Supply table at basic prices incl. transformation into purchasers' prices

`naio_10_cp16` Use table at purchasers' prices

`naio_10_cp1610` Use table at basic prices

`naio_10_pyp1610` Use table at basic prices (previous years prices) (naio_10_pyp1610)

`naio_10_cp1620` Table of trade and transport margins at basic prices

`naio_10_pyp1620` Table of trade and transport margins at previous years' prices

`naio_10_cp1630` Table of taxes less subsidies on products at basic prices

`naio_10_pyp1630` Table of taxes less subsidies on products at previous years' prices

`uk_2010_siot` United Kingdom Input-Output Analytical Tables data

Value

A nested data frame. Each input-output table is in a separate row of the nested output, where all the metadata are in columns, and the actual, tidy, ordered input-output table is in the data `data` column.

See Also

Other import functions: `airpol_get()`, `employment_get()`, `iotables_download()`, `iotables_metadata_get()`

Examples

```
# The table must be present in the sessions' temporary directory:
iotables_download(source = "naio_10_pyp1750")

iotables_read_tempdir (source = "naio_10_pyp1750")
```

---

iotable_get   *Get An Input-Output Table Fom Bulk File*

Description

This function is used to filter out a single input-output table from a database, for example a raw file downloaded from the Eurostat website. It provides some functionality to avoid some pitfalls.

Usage

```
iotable_get(
  labelled_io_data = NULL,
  source = "germany_1995",
  geo = "DE",
  year = 1990,
  unit = "MIO_EUR",
  stk_flow = "DOM",
  labelling = "iotables",
  data_directory = NULL,
  force_download = TRUE
)
```

Arguments

labelled_io_data

> If you have downloaded a bulk data file with [iotables_download](), it is faster to work with the data in the memory. Defaults to NULL when the data will be retrieved from the hard disk or from the Eurostat website invoking the same function.

source   A data source, for example naio_10_cp1700.

> naio_10_cp1700 Symmetric input-output table at basic prices (product by product)
>
> naio_10_pyp1700 Symmetric input-output table at basic prices (product by product) (previous years prices)
>
> naio_10_cp1750 Symmetric input-output table at basic prices (industry by industry)
>
> naio_10_pyp1750 Symmetric input-output table at basic prices (industry by industry) (previous years prices)

naio_10_cp15 Supply table at basic prices incl. transformation into purchasers'
     prices

naio_10_cp16 Use table at purchasers' prices

naio_10_cp1610 Use table at basic prices

naio_10_pyp1610 Use table at basic prices (previous years prices) (naio_10_pyp1610)

naio_10_cp1620 Table of trade and transport margins at basic prices

naio_10_pyp1620 Table of trade and transport margins at previous years' prices

naio_10_cp1630 Table of taxes less subsidies on products at basic prices

naio_10_pyp1630 Table of taxes less subsidies on products at previous years'
     prices

For further information consult the [Eurostat Symmetric Input-Output Tables](#)
page.

geo   A country code or a country name. For example, SK or as Slovakia.

year   A numeric variable containing the year. Defaults to 2010, because this year has
                        the most data.

unit   A character string containing the currency unit, defaults to MIO_NAC (million
                        national currency unit). The alternative is MIO_EUR.

stk_flow   Defaults to DOM as domestic output, alternative IMP for imports and TOTAL for
                        total output. For source = 'naio_10_cp1620' and trade and transport margins
                        and source = 'naio_10_cp1630' taxes less subsidies only TOTAL is not used.

labelling   Defaults to iotables which gives standard row and column names regardless
                        of the source of the table, or if it is a product x product, industry x industry
                        or product x industry table. The alternative is short or eurostat which is the
                        original short row or column code of Eurostat or OECD.

data_directory   Defaults to NULL, if a valid directory, it will try to save the pre-processed data
                        file here with labelling.

force_download   Defaults to TRUE. If FALSE it will use the existing downloaded file in the data_directory
                        or the temporary directory, if it exists. Will force download only in a new ses-
                        sion.

Details

Unless you want to work with bulk data files, you should not invoke [iotables_download](#) directly,
rather via this function, if and when it is necessary.

Value

A wide format data.frame with a well-ordered input-output table. The bulk data files on the Eurostat
website are in a long form and they are not correctly ordered for further matrix equations.

Examples

```
germany_table <- iotable_get( source = "germany_1995",
                geo = 'DE', year = 1990, unit = "MIO_EUR",
                labelling  = "iotables" )
```

Description

The function selects the available tables by year or time as a date for a specific country and currency unit in the Eurostat bulk file.

Usage

```
iotable_year_get(
  labelled_io_data = NULL,
  source = "germany_1995",
  geo = "DE",
  unit = "MIO_EUR",
  time_unit = "year",
  stk_flow = "TOTAL",
  data_directory = NULL,
  force_download = TRUE
)
```

Arguments

labelled_io_data

        If you have downloaded a bulk data file with [iotables_download](#), it is faster to work with the data in the memory. Defaults to NULL when the data will be retrieved from the hard disk or from the Eurostat website invoking the same function.

source

        A data source, for example naio_10_cp1700. Symmetric input-output table at basic prices (product by product) (naio_10_cp1700) Symmetric input-output table at basic prices (industry by industry) (naio_10_cp1750) Symmetric input-output table at basic prices (product by product) (previous years prices) (naio_10_pyp1700) Symmetric input-output table at basic prices (industry by industry) (previous years prices) (naio_10_pyp1750) Table of trade and transport margins at basic prices (naio_10_cp1620) and at previous' years prices (naio_10_pyp1620) Table of taxes less subsidies on products at basic prices (naio_10_cp1630) and at previous' years prices (naio_10_pyp1630) For further information consult the [Eurostat Symmetric Input-Output Tables](#) page.

geo

        A country code or a country name. For example, SK or as Slovakia.

unit

        A character string containing the currency unit, defaults to MIO_NAC (million national currency unit). The alternative is MIO_EUR.

time_unit

        Defaults to 'year' and years are returned as numbers. Alternative is to return 'time' as vector of dates.

stk_flow

        Defaults to DOM as domestic output, alternative IMP for imports and TOTAL for total output. For source = 'naio_10_cp1620' and trade and transport margins and source = 'naio_10_cp1630' taxes less subsidies only TOTAL is not used.

data_directory   Defaults to NULL. Use if it you used a data_directory parameter with iotable_get
                  or iotables_download.

force_download   Defaults to TRUE. If FALSE it will use the existing downloaded file in the data_directory
                  or the temporary directory, if it exists. Will force download only in a new ses-
                  sion.

Details

Unless you want to work with bulk data files, you should not invoke iotables_download directly,
rather via this function, if and when it is necessary.

Value

A vector with the years that have available input-output tables.

See Also

Other iotables processing functions: conforming_vector_create(), household_column_get(),
key_column_create(), matrix_round(), output_get(), primary_input_get(), rows_add(),
supplementary_add(), total_tax_add(), vector_transpose_longer(), vector_transpose_wider()

Examples

```
germany_years <- iotable_year_get ( source = "germany_1995", geo = 'DE',
                                    unit = "MIO_EUR" )
```

---

is_html_output   *Check if HTML output is required*

Description

Check if HTML output is required

---

is_latex_output   *Check if Latex output is required*

Description

Check if Latex output is required

---

key_column_create *Create a key columnn*

Description

Create a key column for matching the dimensions of matrixes.

Usage

```
key_column_create(key_column_name, key_column_values = NULL)
```

Arguments

key_column_name

> The name of the key column.

key_column_values

> The value(s) of the key column

Details

This function will likely be used with the creation of coefficients that need to be matched with a matrix that has a key column.

Value

A tibble with one column, named key_column_name and with values key_column_values.

See Also

Other iotables processing functions: conforming_vector_create(), household_column_get(), iotable_year_get(), matrix_round(), output_get(), primary_input_get(), rows_add(), supplementary_add(), total_tax_add(), vector_transpose_longer(), vector_transpose_wider()

Examples

```
key_column_create ("iotables_row", c("CO2_multiplier", "CH4_multiplier"))
```

leontief_inverse_create

Create the inverse of a Leontief-matrix

Description

Create the Leontief inverse from the technology coefficient matrix.

Usage

```
leontief_inverse_create(technology_coefficients_matrix, digits = NULL)

leontieff_inverse_create(technology_coefficients_matrix, digits = NULL)
```

Arguments

technology_coefficients_matrix

A technology coefficient matrix created by the `input_coefficient_matrix_create`.

digits   An integer showing the precision of the technology matrix in digits. Default is
                NULL when no rounding is applied.

Details

The Leontief-inverse is

$$L = (I - A)^- 1$$

where B is the input coefficient matrix created by `input_coefficient_matrix_create`. For the similar inverse created from output coefficients, see the `ghosh_inverse_create` function.

See Also

Other analytic object functions: `ghosh_inverse_create()`, `input_flow_get()`, `leontief_matrix_create()`

Examples

```
tm <- input_flow_get (
  data_table = iotable_get(),
  households = FALSE)
I <- leontief_inverse_create( technology_coefficients_matrix = tm )
```

---

leontief_matrix_create

Create a Leontief matrix

Description

Create a Leontief matrix from technology matrix after some basic error handling. Most likely you will need this function as a step to invoke the function to create its inverse: `leontief_inverse_create`.

Usage

```
leontief_matrix_create(technology_coefficients_matrix)

leontieff_matrix_create(technology_coefficients_matrix)
```

Arguments

```
technology_coefficients_matrix
```
> A technology coefficient matrix created by the `input_coefficient_matrix_create` or `output_coefficient_matrix_create`.

Value

A Leontief matrix of data.frame class. The column names are ordered, and the row names are in the first, auxiliary metadata column.

See Also

Other analytic object functions: `ghosh_inverse_create()`, `input_flow_get()`, `leontief_inverse_create()`

Examples

```
tm <- input_flow_get (
  data_table = iotable_get(),
  households = FALSE)
L <- leontief_matrix_create( technology_coefficients_matrix = tm )
```

---

matrix_round   *Round all matrix values to required number of digits.*

Description

For comparison with results created with other software or published with rounding, systematically round the values of an input-output table, a use, supply, tax or margins table.

Usage

```
matrix_round(data_table, digits = 0)
```

Arguments

data_table	A symmetric input output table, a use, supply, tax or margins table.
digits	An integer number, defaults to 0.

Value

The matrix, with the intact key column and the numeric columns rounded.

See Also

Other iotables processing functions: conforming_vector_create(), household_column_get(),
iotable_year_get(), key_column_create(), output_get(), primary_input_get(), rows_add(),
supplementary_add(), total_tax_add(), vector_transpose_longer(), vector_transpose_wider()

---

metadata	*Metadata*

Description

An arrangement of the Eurostat national accounts vocabulary, used to correctly order wide format
rows and columns from bulk long-form tables.

Usage

```
data(metadata)
```

Format

A data frame with 8 variables.

variable Eurostat vocabulary source, i.e. t_rows, t_cols, prod_na, induse

group Informal labelling for macroeconomic groups

code Eurostat labels

label Eurostat label descriptions

quadrant Where to place the data from a long-form raw data file

account_group Different from Eurostat tables, in thousand national currency units.

numeric_label ordering from quadrant, account_group, digit_1, digit_2

iotables_label Custom, machine_readable snake format variable names

Other Metadata datasets: employment_metadata, metadata_uk_2010

---

metadata_uk_2010 *Multipliers and effects (product) for testing from the United Kingdom Input-Output Analytical Tables, 2010*

Description

The Excel-imported UK data.

Usage

```
data(uk_2010_data)
```

Format

A data frame with 10 variables.

variable Constant for the iotable_get function.

uk_row The UK row identifier. Dots and '&' converted to '-'.

uk_col The UK row identifier. Dots and '&' converted to '-'.

uk_row_label The original UK row labels.

uk_col_label The original UK column labels.

eu_prod_na The Eurostat vocabulary equivalent of uk_row

row_order Ordering variable for rows.

col_order Ordering variable for columns.

prod_na The Eurostat-like key values for rows.

induse The Eurostat-like column names

See Also

Other Metadata datasets: [employment_metadata](), [metadata]()

---

multiplier_create *Create multipliers*

Description

This function is in fact a wrapper around the [equation_solve]() function, adding a key column with the name to the multiplier the maintain structural consistency.

Usage

```
multiplier_create(
  input_vector,
  Im,
  multiplier_name = "multiplier",
  digits = NULL
)
```

Arguments

input_vector	An input matrix or vector created by the [input_indicator_create](#) function.
Im	The Leontief inverse as a named object created by the [leontief_inverse_create](#) function.
multiplier_name	
	A variable name to be given to the returned multipliers. Defaults to `multiplier`.
digits	Rounding digits, if omitted, no rounding takes place.

Details

As opposed to direct effects, multipliers are expressed per input of product/industry.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with other matrixes.)

See Also

Other multiplier functions: [input_multipliers_create](#)()

Examples

```
data_table <- iotable_get()

coeff_de <- input_coefficient_matrix_create( data_table )

de_gva_indicator <- input_indicator_create (
  data_table = data_table,
  input = 'gva')  #this is a correct input

I_de <- leontief_inverse_create( coeff_de )

de_gva_multipliers <- multiplier_create (
  input_vector    = de_gva_indicator,
  Im              = I_de,
  multiplier_name = "employment_multiplier",
  digits = 4 )
```

---

netherlands_2006 *Simple input-output table for the Netherlands, 2006.*

Description

This simplified SIOT is taken from the Science Policy Integration for Coastal Systems Assessment project's input-output multiplier specification sheet. It is used as a simple example SIOT for controlled analytical results. The column names were slightly altered to resemble more the current Eurostat conventions and the main example dataset germany_1995.

Usage

```
data(netherlands_2006)
```

Format

A data frame with 14 observations and 13 variables.

A data frame of 13 observations in 14 variables.

prod_na Product name, simplified, following the Eurostat conventions

agriculture_group Simple aggregated agricultural products

mining_group Simple aggregated mining products

manufacturing_group Simple aggregated manufacturing products

construction_group Construction

utilities_group Simple aggregated utilities products/services

services_group Simple aggregated services products

TOTAL Column / row sums, simple summary, not included in the original source

final_consumption_private Simple aggregated final private use

final_consumption_households Simple aggregated final household consumption

final_consumption_government Simple aggregated final government consumption

gross_fixed_capital_formation Gross fixed capital formation 'GFCF'

exports Simple aggregated exports

total_use Simple aggregated total use

---

output_coefficient_matrix_create

Create an output coefficient matrix

Description

Create an output coefficient matrix from the input flow matrix or a symmetric input-output table.

Usage

```
output_coefficient_matrix_create(data_table, total = "tfu", digits = NULL)
```

Arguments

data_table   A symmetric input-output table, a use table, a margins or tax table retrieved by
                the [iotable_get](#). In case you use type="tfu" you need to input a full iotable,
                create by the [iotable_get](#), because the final demand column is in the second
                quadrant of the IOT.

total   The output='total' (or CPA_TOTAL, depending on the names in your ta-
                ble, default) returns the output coefficients for products (intermediates) while
                the final_demand returns output coefficients for final demand. See [Eurostat
                Manual of Supply, Use and Input-Output Tables](#) p495 and p507.

digits   An integer showing the precision of the technology matrix in digits. Default is
                NULL when no rounding is applied.

Details

The output coefficients may be interpreted as the market shares of products in total output. If there
are zero values in present, they will be changed to 0.000001 and you will get a warning. Some
analytical equations cannot be solved with zero elements. You either have faulty input data, or you
have to use some sort of data modification to carry on your analysis.

Value

An output coefficient matrix of data.frame class. The column names are ordered, and the row names
are in the first, auxiliary metadata column.

Examples

```
data_table <- iotable_get()

output_coefficient_matrix_create (data_table = data_table,
                                  total = 'tfu',
                                  digits = 4)
```

---

output_get *Get an output vector*

Description

This is a wrapper function around the primary_input_get function.

Usage

```
output_get(data_table)
```

Arguments

data_table A symmetric input-output table or use table retrieved by the iotable_get function.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with other matrixes.)

See Also

Other iotables processing functions: conforming_vector_create(), household_column_get(), iotable_year_get(), key_column_create(), matrix_round(), primary_input_get(), rows_add(), supplementary_add(), total_tax_add(), vector_transpose_longer(), vector_transpose_wider()

Examples

```
output_get ( data_table = iotable_get () )
```

---

output_multiplier_create
Create output multipliers

Description

Create a data frame of output multipliers.

Usage

```
output_multiplier_create(input_coefficient_matrix)
```

Arguments

`input_coefficient_matrix`

A Leontief inverse matrix created by the `input_coefficient_matrix_create` function.

Details

Output multipliers as defined by the Eurostat Manual of Supply, Use and Input-Output Tables on p500.

Value

A data frame with a key column and the output multipliers of the industries.

Examples

```
de_input_coeff <- input_coefficient_matrix_create(
                           iotable_get(),
                           digits = 4)

output_multiplier_create (de_input_coeff)
```

`primary_inputs`   *Primary input abbreviations*

Description

Only currently used primary inputs. Abbreviations for filtering.

Usage

```
data("croatia_employment_aggregation")
```

Format

A data frame with 105 rows (including empty ones) and 2 variables.

t_rows2 Eurostat code of the input.

t_rows2_lab Labelling of the input by Eurostat.

source Eurostat / DZS

indicator Human readable abbreviation

See Also

---

primary_input_get *Get primary inputs*

Description

This function will retrieve any primary input from the input-output table.

Usage

```
primary_input_get(data_table, primary_input = "compensation_employees")
```

Arguments

data_table   A symmetric input-output table, a use table, or a supply table retrieved by the [iotable_get](#) function.

primary_input   The primary input to be returned from the table.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with other matrixes.)

See Also

Other iotables processing functions: [conforming_vector_create](#)(), [household_column_get](#)(), [iotable_year_get](#)(), [key_column_create](#)(), [matrix_round](#)(), [output_get](#)(), [rows_add](#)(), [supplementary_add](#)(), [total_tax_add](#)(), [vector_transpose_longer](#)(), [vector_transpose_wider](#)()

Examples

```
comp_employees_de <- primary_input_get(
  data_table = iotable_get(),
  primary_input = "compensation_employees")
```

---

rows_add *Add conforming row(s)*

Description

Add a conforming row, or elements of a conforming row to a names matrix.

Usage

```
rows_add(data_table, rows_to_add, row_names = NULL, empty_fill = 0)
```

Arguments

`data_table`	A symmetric input-output table, a use table, a margins or tax table retrieved by the [`iotable_get`]() function.
`rows_to_add`	A data frame or a named numeric vector.
`row_names`	An optional name or vector of names for the key column. Defaults to `NULL`.
`empty_fill`	What should happen with missing column values? Defaults to `0`. If you want to avoid division by zero, you may consider a very small value such as 0.000001.

Details

If you want to add a single row manually, you can input a named numeric vector or a data frame with a single row. For multiple rows, input them as wide form data frame (see examples.)

Value

An extended `data_table` with the new row(s) binded.

See Also

Other iotables processing functions: [`conforming_vector_create`](), [`household_column_get`](), [`iotable_year_get`](), [`key_column_create`](), [`matrix_round`](), [`output_get`](), [`primary_input_get`](), [`supplementary_add`](), [`total_tax_add`](), [`vector_transpose_longer`](), [`vector_transpose_wider`]()

Examples

```
rows_to_add <- data.frame(iotables_row     = "CO2_emission",
                          agriculture_group =  10448,
                          industry_group    =  558327, # -> construction is omitted
                          trade_group       =  11194)

rows_add (iotable_get(), rows_to_add = rows_to_add)

rows_add (iotable_get(),
         rows_to_add = c(industry_group    =  1534,
                         trade_group       =  4),
         row_names    = "CH4_emission" )
```

---

supplementary_add	*Add supplementary data*

Description

Add supplementary data to a SIOT, a use, supply or margins table.

Usage

```
supplementary_add(data_table, supplementary_data, supplementary_names = NULL)
```

Arguments

data_table   A SIOT, a use table, a supply table, or a margins table.

supplementary_data

> Supplementary data to be added. It must be a data.frame or tibble with a key column containing the indicator's name, and the column names must match with the data_table. Can be a vector or a data frame of several rows.

supplementary_names

> Optional names for the new supplementary rows. Defaults to NULL.

Details

This function is a wrapper around the more general rows_add function.

Value

An extended data_table with the new row(s) binded.

A symmetric input-output table with supplementary data, of data.frame class. The column names are ordered, and the row names are in the first, auxiliary metadata column.

See Also

Other iotables processing functions: conforming_vector_create(), household_column_get(), iotable_year_get(), key_column_create(), matrix_round(), output_get(), primary_input_get(), rows_add(), total_tax_add(), vector_transpose_longer(), vector_transpose_wider()

Examples

```
de_io <- iotable_get()
CO2_coefficients <- data.frame(agriculture_group = 0.2379,
                               industry_group    = 0.5172,
                               construction = 0.0456,
                               trade_group = 0.1320,
                               business_services_group = 0.0127,
                               other_services_group = 0.0530)
CH4_coefficients <- data.frame(agriculture_group = 0.0349,
                               industry_group    = 0.0011,
                               construction = 0,
                               trade_group = 0,
                               business_services_group = 0,
                               other_services_group = 0.0021)
CO2 <- cbind (data.frame(iotables_row = "CO2"),
              CO2_coefficients)
CH4 <- cbind(data.frame (iotables_row = "CH4_coefficients"),
             CH4_coefficients)
de_coeff <- input_coefficient_matrix_create ( iotable_get() )
emissions <- rbind (CO2, CH4)

# Check with the Eurostat Manual page 494:
supplementary_add(de_io, emissions)
```

---

total_tax_add   *Summarize and add tax data*

Description

Create and add a total tax row, if there are multiple tax rows present in the data_table.

Usage

```
total_tax_add(
  data_table,
  tax_names = c("d21x31", "d29x39"),
  total_tax_name = "TOTAL_TAX"
)
```

Arguments

data_table   A SIOT, a use table, a supply table, or a margins table that has product and
               production tax rows in among the primary inputs.

tax_names   Defaults to ("d21x31", "d29x39"), which are the Eurostat names for taxes.
               The parameter is not case sensitive.

total_tax_name Defaults to 'TOTAL_TAX'. The name of the summarized row. It is case sensitive.

Value

A data frame with the vector of multipliers and the an auxiliary metadata column (for joining with
other matrixes.)

See Also

iotable_year_get(), key_column_create(), matrix_round(), output_get(), primary_input_get(),
rows_add(), supplementary_add(), vector_transpose_longer(), vector_transpose_wider()

Examples

```
de_io <- iotable_get()

total_tax_add (de_io,
                tax_names = c("net_tax_products",  "net_tax_production"),
                total_tax_name = "total_tax")
```

---

uk_2010_data	*United Kingdom Input-Output Analytical Tables, 2010*

Description

Replication data exported from the Office of National Statistics.

Usage

```
data(uk_2010_data)
```

Format

A data frame with 10 variables.

uk_row The UK row identifier. Dots and '&' converted to '-'.

uk_row_lab The original UK row labels.

uk_col The UK row identifier. Dots and '&' converted to '-'.

uk_col_lab The original UK column labels.

geo Eurostat-style geocode, i.e. UK

geo_lab United Kingdom

indicator The name of the indicator, i.e. Excel sheet.

unit Eurostat label equivalents units, i.e. MIO_NAC.

unit_lab Eurostat label equivalents, i.e. millions of national currency unit.

values The numeric values of the variable

year Constant = 2010.

Details

You can retrieve the data with [iotable_get](), setting the source parameter as follows:

uk_2010_siot Input-Output table (domestic use, basic prices, product by product)

uk_2010_use Domestic use table at basic prices (product by industry)

uk_2010_imports Imports use table at basic prices (product by product)

uk_2010_coeff Matrix of coefficients (product by product)

uk_2010_inverse Leontief Inverse (product by product)

---

uk_2010_results_get   *Get United Kingdom Multipliers and Effects, 2010*

Description

This function will retrieve the published effects and multipliers from the United Kingdom Input-Output Analytical Tables, 2010 (consistent with UK National Accounts Blue Book 2013 & UK Balance of Payments Pink Book 2013) by Richard Wild.

Usage

```
uk_2010_results_get(path = NULL)
```

Arguments

path   A path to the downloaded file, if already exists, given with file.path() function.

Source

ukioanalyticaltablesio1062010detailedpubversion.xls

Examples

```
## Not run:
uk_results <- iotables:::uk_2010_results_get ()

## End(Not run)
```

---

uk_test_results   *Multipliers and effects (product) for testing from the United Kingdom Input-Output Analytical Tables, 2010*

Description

The Excel-imported UK data.

Usage

```
data(uk_test_results)
```

Format

A data frame with 12 variables.

uk_row_label The UK row label

Output multiplier The imported Output multipliers

output_multiplier_rank The imported ranking of output multipliers

Employment cost multiplier The imported Employment cost multipliers.

employment_cost_multiplier The imported ranking of Employment cost multipliers.

Employment cost effects The imported Employment cost multipliers.

employment_cost_effects_rank The imported ranking of employment cost multipliers.

GVA effects The imported GVA effects.

gva_effects_rank The imported ranking GVA effects.

gva_multiplier_rank The imported ranking GVA multipliers.

GVA multiplier The imported GVA multipliers.

indicator Indicator names.

vector_transpose_longer

Transpose a vector to a long form

Description

Many vectors (indicators, multipliers) are create in the wide form to conform matrixes in analytical functions. For printing it is more useful to have them in long form.

Usage

```
vector_transpose_longer(
  data_table,
  names_to = "nace_r2",
  values_to = "value",
  key_column_name = NULL,
  .keep = FALSE
)

vector_transpose(
  data_table,
  names_to = "nace_r2",
  values_to = "value",
  key_column_name = NULL,
  .keep = FALSE
)
```

Arguments

`data_table`	A matrix or vector that normally has a key column.
`names_to`	Defaults to `'nace_r2'`.
`values_to`	Defaults to `'value'`.
`key_column_name`	
	The name of the first column. Defaults to `NULL` when it is not changed. It should usually match the key column of the matrix or vector you would like to join the new vector created with `vector_transpose_longer`.
`.keep`	Keep the indicator identifier column? Defaults to `FALSE`.

Details

This is a wrapper around [pivot_longer](#) so you do not necessarily need to import or load the entire *tidyr* package.

Value

A long form vector with a key column, and optionally the identifier of the indicator in the first column.

See Also

Other iotables processing functions: [conforming_vector_create](#)(), [household_column_get](#)(), [iotable_year_get](#)(), [key_column_create](#)(), [matrix_round](#)(), [output_get](#)(), [primary_input_get](#)(), [rows_add](#)(), [supplementary_add](#)(), [total_tax_add](#)(), [vector_transpose_wider](#)()

Examples

```
vector_transpose_longer(
  data.frame(indicator = "my_inidcator",
             agriculture = 0.0123,
             manufacturing = 0.1436,
             trade = 0.0921)
)
```

---

vector_transpose_wider

Transpose a vector to wider format

Description

Many vectors (indicators, multipliers) are create in the wide form to conform matrixes in analytical functions. For binding it is more useful to have them in wide format.

Usage

```
vector_transpose_wider(
  data_table,
  names_from,
  values_from,
  key_column_name = NULL,
  key_column_values = NULL
)
```

Arguments

data_table   A matrix or vector that normally has a key column. If the key column must be
                 created or replaced, used key_column_name and key_column_values.

names_from, values_from

                 A pair of arguments describing which column (or columns) to get the name of
                 the output column ('names_from'), and which column (or columns) to get the
                 cell values from ('values_from').

key_column_name

                 The name of the key column.

key_column_values

                 You can explicitly supply key column values. Defaults to NULL when the key
                 column values will be created from the long data.

Details

This is a wrapper around [pivot_wider](#) so you do not necessarily need to import or load the entire
tidyr package.

See Also

Other iotables processing functions: [conforming_vector_create](#)(), [household_column_get](#)(),
[iotable_year_get](#)(), [key_column_create](#)(), [matrix_round](#)(), [output_get](#)(), [primary_input_get](#)(),
[rows_add](#)(), [supplementary_add](#)(), [total_tax_add](#)(), [vector_transpose_longer](#)()

Examples

```
vector_transpose_wider (data_table =  germany_airpol[, -2],
                        names_from = 'induse',
                        values_from = 'value')

vector_transpose_wider (data_table =  germany_airpol[1:8, 3:4],
                        names_from = 'induse',
                        values_from = 'value',
                        key_column_values = "CO2_emission" )
```
